

# Email Archiving and Retrieval

As electronic content keeps growing exponentially, so too does the amount and importance of email. Companies are required by law and regulation to treat the storage and retrieval of email with no less criticality than that of any other records of business. In all aspects of Electronic Records Management, compliant Email Archive/Retrieval solutions must keep pace as discovery costs and regulatory burdens keep increasing. A solution needs to be cost-effective, demonstrating a Return on Investment that fulfills the critical business drivers relating to *Legal, Compliance, Security, Storage and Productivity* requirements associated with email.

**Data Vault™**

Our DataVault™ Email Archiving and Retrieval Managed Service offers a complete solution that can eliminate storage constraints and protect your organization from regulatory risk and legal liabilities associated with electronic messaging communications, with minimal cost and impact. DataVault™ allows organizations to search for, access and quickly retrieve any archived email record quickly and easily, while providing a secure audit trail for that message.

Backup solutions alone cannot satisfy the regulatory, discovery and retention needs for electronic records - an automated email archiving solution is necessary. DataVault™ is a hosted solution designed to process millions of messages and archive hundreds of gigabytes per day in a high availability and high performance fashion. The mail system is configured to automatically place a copy into the archive, eliminating the need to keep historical messages on your mail server - and the dangerous incentive for users to keep extensive local email files. As a result, our DataVault™ Service offers the most robust, comprehensive and scalable enterprise archival solution available today. DataVault™ dramatically reduces the ongoing cost of email storage and management, and ensures that valuable information can be retrieved quickly and efficiently.

DataVault™ provides for the real-time capture, full-text indexing and archive management of emails and attachments. The business value proposition comes with assisting organizations to reduce the risks and costs associated with responding to litigation or discovery requests, by making records easily accessible, ensuring that email records cannot be altered (are fully compliant) and by providing auditing and reporting of the record's history. Just as importantly, from a pure productivity, efficiency and business continuity standpoint, it's also certainly significant that a company's communications life blood - email - has its burgeoning message storage relieved with DataVault™.

*Croop's DataVault™ Email Archiving and Retrieval Managed Service provides full management of the records lifecycle - from creation to disposition, archive or deletion.*
